

Playhavior Demo: Development Tools and Purpose

Tool/Software	Why I'm using it in PlayHavior
Java JDK 21	Provides the Java tools I need to compile and run Playhavior.
IntelliJ IDEA Ultimate	My main workspace for writing, organizing, running, and debugging the Java and Spring Boot code.
Spring Boot	The framework I am using to build Playhaviors backend, organize its features and connect it to the database.
H2 Database	A starter database used when I begin developing for quick local testing.
PostgreSQL	A database I will use later in development to store the projects data in a more realistic and sustainable database environment.
DBeaver	Visual database tool used to look at the PostgreSQL tables, review data, and run SQL queries.
Git and GitHub Desktop	Used to track changes to the project, create commits, and back up the code in the PlayHavior GitHub repository
GitHub	Online repository for storing the project code, documentation, version history, and project updates for my instructor
Postman	Used to test the backend API endpoints and make sure that the requests and responses work right.
Word and PDF	Used for project planning, technical notes, capstone documentation, and presentation materials.
